LinkedIn Post — DSA Revision: Dynamic Programming

DSA Revision: Dynamic Programming

Today I revised **Dynamic Programming (DP)** and focused mainly on **how to recognize a DP problem** before starting to code.

The patterns I revised:
• **Take / Skip DP**
• **1D DP**
• **2D DP**
• **Knapsack / Pick-Not Pick**
• **Memoization & Tabulation**
• Identifying the **DP state, base case, and recurrence**

One pattern I found especially useful:

House Robber → 1D Take/Skip DP

At every index, I have two choices:

→ **Take** the current element and move to the next valid state
→ **Skip** the current element and move to the next state

My main takeaway today:

Choices + repeated subproblems + optimization/counting → Think DP

I'm continuing my DSA revision by focusing on **pattern recognition instead of memorizing solutions**. One pattern at a time.
